

## A short introduction to the Rock Mass index (R<sub>Mi</sub>) and its applications

by Arild Palmström, Ph.D.

An important issue has been to use parameters in the R<sub>Mi</sub>, which have the greatest significance in engineering. The main principles in the R<sub>Mi</sub> value and the input data used are shown in Figures 1 and 2.

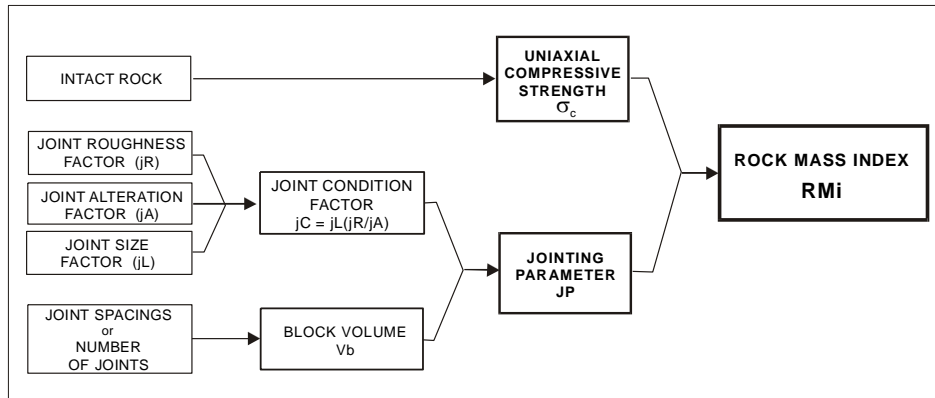

Figure 1 The layout of the Rock Mass index, R<sub>Mi</sub>

Figure 2 The main parameters in the rock mass are included in the RockMass index, which approximately characterizes the uniaxial compressive strength of a rock mass.

R<sub>Mi</sub> is based on the principle that the joints intersecting a rockmass tend to reduce its strength. Consequently, it is expressed as:  $R_{Mi} = \sigma_c \times JP$

Here  $\sigma_c$  = the uniaxial compressive strength of intact rock (in MPa), measured on 50 mm samples.

JP = the jointing parameter, expressing the reduction in strength of the intact rock caused by the joints. As shown in Figure 1 it incorporates the main joint features in the rock mass. The expression for JP was found using the diagram in Figure 3.

Figure 3 Test results from 8 large scale compressive strength tests or back calculations were used to find the expression for the jointing parameter, JP. The known data for the samples were plotted in the diagram and the lines for the joint characteristics, jC, were drawn as shown. These lines represent the expression for JP. Unfortunately, it was not possible to detect more than the 8 large scale test results, though many organisations and companies were contacted.

From Figure 3 the Jointing Parameter was found as  $JP = 0.2\sqrt{jC} \times Vb^D$

where  $D = 0.37jC^{-0.2}$

The diagram in Figure 3 can be used to find JP when Vb and jC are known from field observations or estimated from site descriptions. The values or ratings of the input joint features incorporated in JP are shown in Table 1.

As R<sub>Mi</sub> is a measure for the strength of a rock mass it can be applied in several applications. The main are shown in Figure 4.

Table 1 The input parameters to RMI

|   |   |  |  |                          |                                     |                         |
|---|---|--|--|--------------------------|-------------------------------------|-------------------------|
| <b>Uniaxial compressive strength of intact rock (<math>\sigma_c</math>)</b>   |   | <b>value</b> in MPa (from lab. tests or assumed from handbook tables)                              |  |                          |                                     |                         |
| <b>Block volume (<math>V_b</math>)</b>  |   | <b>value</b> in $m^3$ (from observations at site or on drill cores, etc.)                          |  |                          |                                     |                         |
| <b>Joint condition factor (<math>jC</math>)</b>   |   | <b><math>jC = jR \times jL / jA</math></b> (ratings of $jR$ , $jA$ and $jL$ from the tables below) |  |                          |                                     |                         |
| <b><math>jR</math></b> (joint roughness factor, which is composed of large scale and small scale undulations, similar to $J_r$ in the Q-system) |   |  |  |                          |                                     |                         |
| (The ratings in <b><i>bold italic</i></b> are similar to $J_r$ )  |   | Large scale waviness of joint plane  |  |                          |                                     |                         |
|   |   | Planar   | Slightly undulating                                | Undulating               | Strongly undulating                 | Stepped or interlocking |
| Small scale smoothness of joint surface   | Very rough  | 2  | 3  | 4                        | 6                                   | 6                       |
|   | Rough   | <b>1.5</b>   | 2  | <b>3</b>                 | 4.5                                 | 6                       |
|   | Smooth  | <b>1</b>   | 1.5  | <b>2</b>                 | 3                                   | 4                       |
|   | Polished or slickensided <sup>*)</sup>  | <b>0.5</b>   | 1  | <b>1.5</b>               | 2                                   | 3                       |
|   | For filled joints $jR = 1$ For irregular joints a rating of $jR = 6$ is suggested |  |  |                          |                                     |                         |
| *) For slickensided surfaces the ratings apply to possible movement along the lineations  |   |  |  |                          |                                     |                         |
| <b><math>jA</math></b> (joint alteration factor, which ratings are based on $J_a$ in the Q-system)  |   |  |  |                          |                                     |                         |
| Contact between joint walls   | CLEAN JOINTS:   | Healed or welded joints  | filling of quartz, epidote, etc.                   |                          | $jA = 0.75$                         |                         |
|   |   | Fresh joint walls  | no coating or filling, except from staining (rust) |                          | 1                                   |                         |
|   |   | Altered joint walls  | - one grade higher alteration than the rock        |                          | 2                                   |                         |
|   | - two grades higher alteration than the rock                                      |  | 4  |                          |                                     |                         |
| COATING or THIN FILLING OF:   | Frictional materials  | sand, silt calcite, etc. without content of clay   |  | 3                        |                                     |                         |
|   | Cohesive materials  | clay, chlorite, talc, etc.   |  | 4                        |                                     |                         |
| Partly or no wall contact   | THICK FILLING OF:   | Frictional materials   | sand, silt calcite, etc. (non-softening)           | $jA = 4$                 |                                     | 8                       |
|   |   | Hard, cohesive materials   | clay, chlorite, talc, etc.                         |                          | 6                                   | 5 - 10                  |
|   |   | Soft, cohesive materials   | clay, chlorite, talc, etc.                         |                          | 8                                   | 12                      |
|   |   | Swelling clay materials  | material exhibits swelling properties              |                          | 8 - 12                              | 13 - 20                 |
|   |   |  | Thin filling (< 5 mm)                              |                          | Thick filling                       |                         |
| <b><math>jL</math></b> (joint size factor, which is composed of the length and continuity of the joint)   |   |  |  | <b>Continuous joints</b> | <b>Discont. joints<sup>*)</sup></b> |                         |
| Bedding or foliation partings   |   | length < 0.5 m   |  | $jL = 3$                 |                                     | $jL = 6$                |
| Joints  |   | with length 0.1 - 1 m  |  | 2                        |                                     | 4                       |
|   |   | with length 1 - 10 m   |  | 1                        |                                     | 2                       |
|   |   | with length 10 - 30 m  |  | 0.75                     |                                     | 1.5                     |
